

ABSTRACT OF THE DISCLOSURE

A system for connecting wireless terminals to a WAP gateway and thence to the Internet for providing content to the wireless terminals from Internet web servers includes an AutoLogin proxy and an AutoLogin database associated with the WAP gateway. On an initial login of a particular terminal to a particular web server an entry is made in the AutoLogin database of the user identification, the server URL, and the user-name/password pair required for that user to log in to that server. On subsequent logins to the server the proxy retrieves the user-name/password pair from the database, thus freeing the user of the necessity to enter it for each login which might be cumbersome to do given the limited input facilities provided on wireless terminals.
